

Data collection for EHIS 2019 (French EHIS wave 3) :

The French data for EHIS wave 3 were collected according to a mix of modes. More precisely :

- For individuals for which no phone number was available in the sampling frame, data were collected with face-to-face CATI surveys;
- For individuals for which at least one phone number was available in the sampling frame, the data collection starts with a CATI interview. Individuals that could not be contacted by phone are then identified and a random half of them is assigned to a second step of face-to-face CATI survey.

A subsample of 2 000 individuals for which phone numbers are available is finally randomly selected and directly sent to the face-to-face CAPI data collection, to help identify mode effects.
